

Decision: Use Phase-Oriented Output Naming and Target View Layout

Context

Earlier output names and directories mixed historical test names, converter names, and project phase names. This made it difficult to explain which files belong to Phase 1 and which files are Phase 2 target outputs.

The PoC processing flow distinguishes Phase 1 common Structured CSV generation from Phase 2 target-view generation.

Decision

1. Phase 1 outputs are written under **out/phase1/**.
2. Phase 1 output filenames use the input XML stem with only the extension changed.
3. Phase 1 metadata JSON uses the same stem and the short **.json** extension, not **.csv.metadata.json**.
4. Phase 2 ADS XBRL GL outputs are written under **out/phase2/ADS_XBRL_GL/**.
5. Phase 2 ADS PSV outputs are written under **out/phase2/ADS_PSV/**.
6. Phase 2 ISO 21378 ADC CSV outputs are written under **out/phase2/ISO21378_ADC/**.
7. For directory input, Phase 2 outputs are grouped by Structured CSV stem.
8. Target filenames follow the Figure 1 target view names, such as **Invoices_Received.xbml**, **Invoices_Generated_Lines.xbml**, **Supplier_Listing.psv**, **Customer_Master.psv**, and **PUR_Invoice_Received.csv**.

Consequences

- **samples/input/openpeppol_ubl_invoice_minimal.xml** becomes **out/phase1/openpeppol_ubl_invoice_minimal.csv** and **out/phase1/openpeppol_ubl_invoice_minimal.json**.
- A Phase 2 XBRL GL output for **Allowance-example.csv** becomes **out/phase2/ADS_XBRL_GL/Allowance-example/Invoices_Received_Lines.xbml**.
- ADS PSV follows the same grouping convention under **out/phase2/ADS_PSV/**.
- ISO 21378 ADC CSV follows the same grouping convention under **out/phase2/ISO21378_ADC/**.
- Phase 2 outputs can be compared by source Structured CSV and by target view.
- Test scripts are expected to use these names and directories.
