

Decision: Consolidate Script Processing Documentation Under docs

Context

The project documentation is maintained under **docs/**. The documentation describes the current specification directly: how binding rows, XPath, Semantic Path, Structured CSV dimensions, and converter functions work together.

Decision

1. Keep operational command summaries in **docs/development/README.md** and **docs/testing/README.md**.
2. Keep syntax-binding authoring instructions in **docs/syntax_binding_conversion/** and semantic-binding authoring instructions in **docs/semantic_binding_conversion/**.
3. Keep implementation-level script processing details in **docs/README_SCRIPT_PROCESSING.md**.
4. Use **docs/README_SCRIPT_PROCESSING.md** as the primary explanation for: XPath context processing, Semantic Path interpretation, **dInvoice** and **dInvoiceLine** dimension assignment, internal dictionaries and lists, and function-level conversion flow.
5. Keep **docs/syntax_binding_conversion/** as the syntax-binding program specification and operating guide, but point readers to the consolidated processing guide for implementation-level details.
6. Keep **docs/semantic_binding_conversion/** as the semantic-binding program specification, target coverage report, and operating guide.
7. Use **docs/**, not **doc/**, as the documentation directory.

Consequences

- Script internals are documented in **docs/README_SCRIPT_PROCESSING.md**.
- Subdirectory documents focus on their subject areas.
- Behavior changes update **docs/** together with the corresponding scripts and CSV definitions.
